

# Wide Band Variable Gain Low Noise Amplifier 1GHz-23GHz

## **Product Description**

RAGC0123GA is a wide band variable gain low noise amplifier with a frequency range of 1 to 23GHz.

The power output of this amplifier is 20dBm typical. The typical gain is 33dB with a flatness of  $\pm$ 2.0dB.

The working temperature of this product is between - 40°C and + 85°C.

#### **Features**

- Wide Band Low Noise Amplifier
- Gain 33dB Typical
- P1dB Output Power 20dBm Typical
- Output Saturation Power 23dBm Typical
- Supply Voltage +12V
- 50 Ohm Matched Input/Output
- Low Noise Figure +3.0dB Typical
- Gain Flatness +/-2.0dB

## **Typical Applications**

- Wireless Infrastructure
- Military and Aerospace Applications
- Test Instrumentation
- Radar Systems
- 5G Wireless Communications
- Microwave Radio Systems
- · TR Modules
- · Research and Development
- · Cellular Base Stations

#### Notes

- 1. Package Material: Aluminum
- 2. Finish: Gold Plated
- 3. All dimensions are in millimeters [inches].
- 4. Housing Tolerances  $\pm 0.1$  [0.004] unless otherwise specified(Excl Heat Sink).
- 5. Heat sink required during operation (sold separately). Matching heatsink is listed on our website. If customer would like to use their own cooling method, please make sure the amplifier will operate under the specs that listed in page 2 of this datasheet.
- 6. Standard torque wrench must be used to secure RF connectors.

#### **Ordering Information**

Part Number	Modification	Description
RAGC0123GA	Standard	1GHz-23GHz Low Noise Amplifier

#### **Amplifier Use**

Ensure that the amplifier input and output ports are safely terminated into a proper 50 ohm load before turning on the power. Never operate the amplifier without a load. A proper 50 ohm load is defined as a load with impedance less than 1.9:1 or return loss larger than 10dB relative to 50 Ohm within the specified operating band width.

#### Power Supply Requirements

Power supply must be able to provide adequate current for the amplifier. Power supply should be able to provide 1.5 times the typical current or 1.2 times the maximum current (whichever is greater).

In most cases, RF - Lambda amplifiers will withstand severe mismatches without damage. However, operation with poor loads is discouraged. If prolonged operation with poor or unknown loads is expected, an external device such as an isolator or circulator should be used to protect the amplifier.

Ensure that the power is off when connecting or disconnecting the input or output of the amp.

Prevent overdriving the amplifier. Do not exceed the recommended input power level.

Adequate heat-sinking required for RF amplifier modules. Please inquire.

Amplifiers do not contain Thermal protection, Reverse DC polarity or Over voltage protection with the exception of a few models. Please inquire.

Proper electrostatic discharge (ESD) precautions are recommended to avoid performance degradation or loss of functionality.

What is not covered with warranty?

Each RF - Lambda amplifier will go through power and temperature stress testing.

Since the die, ICs or MMICs are fragile, these are not covered by warranty. Any damage to these will NOT be free to repair.
